

Name + kind — header, color/glyph already carries kind.

1. The active effect in its current context.
  - Weapon, chained: effective Damage / Attack Speed / Cost + pool.
  - Attachment, chained: its contribution delta.
  - Anything unchained: the passive affinity.
2. Attack type sentence — Delivery x Affinity x Anchor ("Cleave - enemies - at target").
3. Trigger: when does this chain fire.
4. Payload flag — one compact line if the weapon carries one ("payload: AoE 2 on target").

### Details (Alt) — the "why" layer

- Base → effective breakdown: base weapon values and which chain pieces contributed what (the breadcrumbs / per-contributor deltas).
- The counterfactual state: unchained numbers while chained, and vice versa. I'd demote the current always-both TwoStateBlock here — the inactive state is planning info, not combat info. (The active state is combat info, not planning info.)
- Derived numbers: DPS, cost per second, damage per mana. Genuinely useful, but they're arithmetic on Tier-1 numbers — the instant view shouldn't spend lines on math the player can do.
- Payload mechanics: marginal cost + type, timing, shape size.
- Modifier mechanics: FlatAdd vs PercentAdd vs Overwrite on the affix/input/output mods — matters for optimizers, noise for everyone else.

Diagram illustrating the initial state of the system with two parallel processes:

- Process 1 (Left):
  - Initial state: **ItemName** (red box) and a blue circle.
  - Operation 1: **0 x** (red circle).
  - Operation 2: **0 x** (green circle).
  - Operation 3: **+ 0 x** (blue circle).
- Process 2 (Right):
  - Initial state: **ItemName** (red box) and a blue circle.
  - Operation 1: **+ 0 x** (red circle).
  - Operation 2: **0 x** (green circle).
  - Operation 3: **0 x** (blue circle).

Red arrows indicate the flow of operations between the two processes.

Figure 1 displays four panels, each representing a different combination of items and their effects on a character's stats. The panels are labeled as follows:

- Wooden Sword:** Shows a wooden sword icon, a level of 5, a duration of 1.50 s, and a +2 bonus to the sword icon.
- Sword Fish:** Shows a sword fish icon, a level of 2, a duration of 1, and a +5 bonus to the sword icon.
- Banana:** Shows a banana icon, a level of +5 %, a duration of +10 %, and a +3 % bonus to the banana icon.
- Banana:** Shows a banana icon, a level of +3 %, a duration of 5 %, and a 10 % bonus to the banana icon.

Three panels showing different UI styles for the same data. The first panel, 'Blood Magic', has a dark background with orange and red accents, showing a red circle with '1', a blue circle with '→', and a blue circle with '+3'. The second panel, 'Libra', has a dark background with blue and white accents, showing a blue circle with '5%', a clock icon with '1 s', and a blue circle with '+3 %'. The third panel, 'Fire Spark', has a dark background with blue and white accents, showing a blue circle with '1', a clock icon with '0 →', and a blue circle with '+3'.

### Item Chain Examples
